Spend-and-tax: A Panel Data Investigation for the EU

Abstract

Using bootstrap panel analysis, allowing for cross-country correlation, without the need of pre-testing for unit roots, we study the causality between government spending and revenue for the EU in the period 1960-2006. We find spend-and-tax causality for Italy, France, Spain, Greece, and Portugal, while tax-and-spend evidence is present for Germany, Belgium, Austria, Finland and the UK, and for several EU New Member States. Moreover, in the run-up to EMU there was some shifting away from a spend-and-tax strategy, implying adjustments of fiscal behaviour.

JEL Code: C23, E62, H62.

Keywords: panel causality, fiscal policy, EU.

1. Introduction

Fiscal sustainability studies usually assess the existence of a long-term cointegration relationship between government revenue and spending.¹ Nevertheless, an important feature linked to the existence of such cointegration relation is the direction of causality between spending and revenue, which conveys how fiscal policy is set-up in practice. Indeed, one may have one-way Granger-causality from spending (revenue) to revenue (spending), i.e. “spend-and-tax” (“tax-and-spend”) causality, two-way causality or no Granger-causality between revenue and spending.

The literature essentially assesses the existence of causality in a single country set-up.² However, there is economic rationale for undertaking a panel approach, taking advantage of non-stationary panel data econometric techniques. In the European Union (EU), and even if there is no single fiscal policy in place, panel analysis is relevant in the context of countries seeking to pursue sound fiscal policies within the framework of the Stability and Growth Pact. Cross-country dependence can be envisaged in the run-up to Economic and Monetary Union (EMU), via peer pressure or via integrated financial markets. Moreover, cross-country spillovers in government bond markets are to be expected, and interest rates comovements inside the EU have also gradually become more noticeable.

This paper contributes to the literature with a bootstrap panel analysis of causality between government revenue and spending in the EU country set, to assess which countries are characterised by a tax-and-spend or by a spend-and-tax behaviour during the period 1960-2006. Section two explains the methodology, section three reports the empirical analysis and section four concludes.

2. Methodology

We employ the panel data approach of Kónya (2006), based on a bivariate finite-order vector autoregressive model, and we apply it in our context to general government revenue, R , and spending, G :³

$$\begin{cases} R_{it} = \mathbf{a}_{1,i} + \sum_{j=1}^{p_{1i}} \mathbf{b}_{1,i,j} R_{i,t-j} + \sum_{j=1}^{p_{2i}} \mathbf{g}_{1,i,j} G_{i,t-j} + \mathbf{e}_{1,i,t} & t = 1, \dots, T \quad i = 1, \dots, N \\ G_{it} = \mathbf{a}_{2,i} + \sum_{j=1}^{p_{1i}} \mathbf{b}_{2,i,j} R_{i,t-j} + \sum_{j=1}^{p_{2i}} \mathbf{g}_{2,i,j} G_{i,t-j} + \mathbf{e}_{2,i,t} & t = 1, \dots, T \quad i = 1, \dots, N \end{cases} \quad (1)$$

where the index i ($i = 1, \dots, N$) denotes the country, the index t ($t = 1, \dots, T$) the period, j the lag, and p_{1i} , p_{2i} and p_{3i} , indicate the longest lags in the system. The error terms, $\mathbf{e}_{1,i,t}$ and $\mathbf{e}_{2,i,t}$, are supposed to be white-noises and may be correlated with each other for a given country.

System (1) is estimated by the Seemingly Unrelated Regressions (SUR) procedure, since possible links may exist among individual regressions via contemporaneous correlation⁴ within the two equations. Wald tests for Granger causality are performed with country specific bootstrap critical values generated by simulations.

¹ Afonso (2005) explains the relevant linkages and reviews the empirical evidence. Afonso and Rault (2007) test the cointegration relationship with panel unit root and cointegration tests, allowing for correlation within and between units.

² See, for instance, von Furstenberg et al. (1986), Chang et al. (2002), Payne (2004), and Kollias and Paleologou (2006).

³ We are grateful to L. Kónya for providing his TSP codes, which we have adapted for our analysis.

⁴ A likely assumption for macroeconomic time series for EU countries, with strong economic links.

With respect to system (1), in country i there is one-way Granger-causality from G to R if in the first equation not all $\mathbf{g}_{1,i}$ are zero but in the second all $\mathbf{b}_{2,i}$ are zero; there is one-way Granger-causality from R to G if in the first equation all $\mathbf{g}_{1,i}$ are zero but in the second not all $\mathbf{b}_{2,i}$ are zero; there is two-way Granger-causality between R to G if neither all $\mathbf{b}_{2,i}$ nor all $\mathbf{g}_{1,i}$ are zero; and there is no Granger-causality between R to G if all $\mathbf{b}_{2,i}$ and $\mathbf{g}_{1,i}$ are zero.⁵

This procedure has several advantages. Firstly, it does not assume that the panel is homogeneous, being possible to test for Granger-causality on each individual panel member separately. However, since contemporaneous correlation is allowed across countries, it makes possible to exploit the extra information provided by the panel data setting. Secondly, it does not require pre-testing for unit roots and cointegration (since country specific bootstrap critical values are generated), though it still requires the specification of the lag structure. This is an important feature since the unit-root and cointegration tests in general suffer from low power, and different tests often lead to contradictory outcomes. Thirdly, this approach allows detecting for how many and for which members of the panel there exists one-way, two-way, or no Granger-causality.

3. Empirical analysis

Data for general government expenditure and revenue are taken from the European Commission AMECO database.⁶ The data cover the periods 1960-2006 for the EU15 countries, and 1998-2006 for the EU25 countries and the unbalanced panels are used for the SUR analysis and Granger-causality testing.⁷ The following panels are used: EU15 (Austria, Belgium, Denmark, Finland, France, Germany, Greece, Italy, Ireland, Luxembourg, the Netherlands, Portugal, Spain, United Kingdom, and Sweden); and EU25 (EU15 countries, Bulgaria, Czech Republic, Estonia, Hungary, Lithuania, Latvia, Malta, Poland, Slovakia and Slovenia).

We use government spending and revenue data as a ratio of GDP. Apart from the fact that ratios of nominal magnitudes are commonly used in the international debate, it is also important to scale the variables for the panel approach. In addition, the bootstrap causality test that we use does not require unit root testing.

Table 1 shows the results of the causality tests for the EU15 panel for the period 1960-2006. It is possible to observe that while government revenue positively causes government spending for Germany and negatively for Ireland, there are more cases pointing to the spend-and-tax hypothesis: Austria, France, Greece, Italy, Spain, and Sweden.

[Table1]

We also compared the results (not shown) for two sub-periods, 1960-1985 and 1986-2006. In the first sub-period, causality from revenue to spending occurs in six countries, while causality from spending to revenue is detected for Greece, Italy and Portugal. In addition, the tax-and-spend result is obtained for Portugal in the second sub-period while a negative causality from revenue to spending is found for Italy and Belgium, which may

⁵ This implies a one period ahead causality.

⁶ The AMECO codes are as follows: total expenditure (% of GDP), .1.0.319.0.UUTGE, .1.0.319.0.UUTGF; total revenue (% of GDP), .1.0.319.0.URTG, .1.0.319.0.URTGF.

⁷ For the SUR approach to work properly, the time series dimension should be substantially larger than N , a condition that is only fulfilled for the EU25 over the 1998-2006 period. Therefore, for the EU25 panels the SUR estimation is performed on the (unbalanced) 1970-2006 period.

signal increased concerns regarding fiscal behaviour in the run-up to EMU. On the other hand, the spend-and-tax result occurs in the second sub-period for France and Ireland.

Table 2 reports the results for the EU25 country sample, considering most of the EU New Member States (NMS). The spend-and-tax result is still found for Austria, France, Greece, Italy, and Spain, and causality still runs from revenue to spending in the case of Germany and Luxembourg. On the other hand, the evidence shows causality from revenue to spending in several EU New Member States: Czech Republic, Estonia, Lithuania, and Poland. Finally, two countries exhibit two-way, bi-directional causality between government revenue and spending: Ireland and Slovakia. Table 3 summarises the causality results.

[Table2]

[Table3]

4. Conclusion

We used a bootstrap panel analysis of causality between government revenue and spending for the EU, which allows for contemporaneous correlation across countries and dispenses the need of pre-testing for unit roots. The results support the so-called spend-and-tax causality for such countries as Italy, France, Spain, Greece, and Portugal. Tax-and-spend evidence is present notably for Germany, Belgium, Austria Finland and the UK, and also for several EU New Member States. Some changes regarding the direction of the causality patterns can also be detected, after the 2nd half of the 1980s, notably with countries like Greece, Italy, and Portugal, shifting away from a spend-and-tax strategy, which may imply welcome adjustments of fiscal behaviour in the run-up to EMU.
